## Highlights

---

My current research centers on unsupervised learning and AutoML. This fits well with a nascent and fast-evolving research field referred to as **Neural Architecture Search**, which aims to automate deep learning model design and reduce the cost of manually designed models across different use cases. My work covers the entire spectrum of research in this domain: from studying single/multi-fidelity optimization methods, to understand architecture encodings and its clustering effect through theoretical analysis and empirical evaluations.
