Highlights

My current research centers on efficient Transformers and AutoML. This fits well with a nascent and fast-evolving research field referred to as **Neural Architecture Search**, which aims to automate deep learning model design and reduce the cost of manually designed deep learning models across different use cases. My work covers the entire spectrum of research in this domain: from building efficient optimization algorithms to search specialized neural network on cheap mobile devices, to understand architecture encodings and its clustering effect through theoretical analysis and empirical evaluations.
